THE COUNCIL FOR TOBACCO RESEARCH-U.S.A., INC.

110 EAST 59TH STREET NEW YORK, N. Y. 10022

Application for Research Grant (Use extra pages as needed)

1. Principal Investigator (give title and degrees):

A. Charles Mittman, M.D., Director, Respiratory Disease Department B. Jack Lieberman, M.D., Associate Director, Respiratory Disease Dept.

2. Institution & address:

City of Hope Medical Center

1500 East Duarte Road

Duarte CA 91010

3. Department(s) where research will be done or collaboration provided:

Respiratory Disease Department, City of Hope Medical Center, Duarte, California 91010

A. Short title of study:

Round Heart Disease in Turkeys: A model of Antitrypsin Deficiency in Man

5. Proposed starting date: July 1, 1975

6. Estimoted time to complete: Three years 6. Estimoted time to complete: Three years
7. Brief description of specific research aims:

Investigators at the Kimron Veterinary Institute of Tel Aviv University, Israel, have demonstrated that the pathology in turkey round heart disease (RHD) shares certain features with antitrypsin deficiency in man (see accompanying application). Specifically, birds who die with RHD have a deficiency of alpha1-globulins and specific intracytoplasmic globules in their liver cells. Studies on material sent to our laboratory from Israel confirm that the histochemical properties of the globules and their location in rough endoplasmic reticulum are identical to that seen in human material. We are currently conducting studies on material from turkeys dying of RHD in California.

This proposal requests funds to permit continued collaboration between our laboratory and the investigators in Israel. Specifically, we will be responsible for the following aspects of the study:

1) Consult with the Israeli investigators and assist in establishing procedures for the electrophoretic differentiation of the normal and aberrant alpha protease inhibitor.

2) Chemically characterize the inhibitor isolated from the liver of normal and deficient turkeys.

3) Carry out electron microscopic studies of tissues from diseased and normal turkeys.

4) Determine if the condition recognized as round heart disease in turkeys in the United States is the same as that observed in See application of Trainin, et al)

9. Details of experimental design and procedures (append extra pages as necessary)

For a number of years our laboratory has been studying various aspects of alpha, -antitrypsin deficiency (AATD) in man. Progress in understanding the basic defect in this inherited condition would be greatly accelerated if an animal model of the deficiency were available. Turkey round heart disease (RHD) appears to be associated with the same hepatic abnormality seen in human antitrypsin deficiency. Accordingly, study of RHD may yield important insights as to the cellular defect which interferes with normal hepatic synthesis and/or release of antitrypsin. The group at the Kimron Veterinary Institute in Israel first recognized the similarity between RHD and AATD. They are ideally situated to carry out certain aspects of the proposed research. Specifically, they have ready access to large numbers of diseased and healthy birds, have the facilities needed to carry out the crucial breeding studies, and are in possession of most of the equipment and skills needed for this project. Our group will contribute its experience with the various-electrophoretic techniques for identifying variant antitrypsin types and its familiarity with the methods for isolating and characterizing the protein in liver and serum. (Please see reprint, Matsubara, Yoshida and Lieberman. Proc Nat Acad Sci 71:3334, 1974.)
The necessary electron microscopic studies of various tissues will be performed in our laboratory. (Please see reprint, Gordon, Dixon, Rogers, Mittman, and Lieberman. Human Path 3:361, 1972.) Finally, techniques similar to those outlined above will be applied to material from turkeys dying of RHD in the United States.

The Biochemistry Laboratory of the Respiratory Disease Department, City of Hope Medical Center, occupies 1600 square feet and contains all the equipment needed to carry out the required electrophoretic and biochemical studies. Protein characterizations are conducted in collaboration with the Department of Biochemical Genetics at the City of Hope (Dr. A. Yoshida, Director). Electron microscopy is performed using the facilities of the Department of Pathology, Laboratory of Cytogenetics and Electron Microscopy (Dr. R. Teplitz, Director).

11. Additional facilities required:

None

12. Biographical sketches of investigator(s) and other professional personnel (append):

· 13. Publications: (five most recent and pertinent of investigator(s); append list, and provide reprints if available).

12. Biographical sketch
